

Presentation of products

simple documentation

The general purpose of the project is to present products on single page, in card form. In every product card the information which is displayed is as follows: one photo of the product, name, price, units in stock, next delivery of this product, button for more information about the product and inactive button for adding the product to a cart.

The technologies used for this project are HTML, CSS, JavaScript and its library jQuery. With HTML are built elements of the page, and stylized with CSS. JavaScript is used to dynamically populate information into HTML tags from given json format as photo, name, price, units in stock and new date of delivery. And jQuery is used to indicate when product is out of stock and to appear more information by clicking on the button "more...".
